

Python looping or iteration statement

→ If you want to execute the certain statements multiple times we have to use looping statements

* Python loops are fundamental programming constructs that allow you to execute a block of code repeatedly

* To managing control flow in programs

We have two types of loops

- 1) For loop
- 2) while loop

Working with for loop

→ For loop is a programming language statement like an iteration statement, which allows a code block to be repeated certain number of times

Syntax:-

for variable - name in sequence - object :
 statements
statements
statements

Print ('outside for loop')

Ex:-

```
for i in range(5):           0, 1, 2, 3, 4
    print('line 1')
    print('line 2')
```

Print (' line 3')

Print (' line 4')

Print (' line 5')

Print (' outside for loop')

while condition

--=
--=
2 --

increment / decrement ---> must be required
