

Defining What is module? Purpose of it?

- If we need to reuse the code in Python then we can define function, but if we need to reuse number of functions then we have to go for modules concept
- * A module is nothing but a file extension of .py which may contain collection of functions, variables and also classes
- In Python every Python files itself known as a module
- Any Python file can be referenced as a module
- In order to use the properties of one module into another module we use import / from statement

How many types of modules are available in Python?

- predefined modules / Built in modules
 - os, math, json, datetime, time, calendar
- User defined modules / custom defined modules
 - calculator.py, demo.py, sample.py
- 3rd party modules / external modules
 - web modules / external modules

→ Django, Flask, NumPy, Pandas, Requests, PyMySQL

→ pip → Python Installer Package

→ By using pip command we can install Python based 3rd party modules

How many ways can we import modules in Python?
