

Python Immutable & mutable object

- * In python every thing we can considered as a object
- * All the datatypes are also considered as a objects only in python
- * every object having its own behaviour based on the behaviour we can categorized in two types

1) Immutable object

- * Not editable object (no changing values) once creating in memory

----> Numbers (int, float, complex) ----> int(), float(), complex()

----> Boolean (bool) ----> bool()

----> String (str) ----> str()

----> Tuple () ----> tuple()

----> frozenset ----> frozenset()

- ② mutable objects --- editable objects once creating in memory

----> List (list)

----> Set (set)

----> Dictionary (dict) =

we change values after creating
