

Dictionary

concept

(most Important)

Dictionary is containing collection of key and value pairs which are enclosed using curly braces

For Example

{key : value1, key2: value2, key3: value3}

In dictionary all keys must be unique keys only but values may be both unique or duplicate

Important table

	List []	Tuple ()	set ()	{ }
"				{3}
'a'	[10]	(10,)	{10}	{1:10}
'abc'	[1,2]	(1,2)	{1,2}	{1:10, 2:20}
str	list	tuple	set	dict
str ()	list ()	tuple ()	set ()	dict ()
duplicates	yes	yes	no	keys-no values-yes
order	yes	yes	no	yes
Indexing	yes	yes	no	

- * Dictionary is a mutable object
- * as a value of dictionary all the mutable and immutable objects allowed
- * as a key of dictionary only immutable objects allowed but not mutable objects
- * Dictionary keys are used as a indexing for accessing value of a given key

* How to creating dictionary object with some keys and values using curly braces

$d = \{ 'ename' : 'virat', 'age' : 30, 'salary' : 10000 \}$

* How to creating dictionary object with some key and value using dict() function

Ex:- $\text{dict}([(1, 20), (2, 10)])$

out $\{ 1 : 10, 2 : 20 \}$

* How to access values from dictionary

$d[key]$

$d.get(key)$

* How to creating new key / value pairs
object [key] = value

* How to updating the dictionary object data

object [key] = value

* How to delete data from dictionary object

del d

del d[key]

dict.clear() ---, {}

dict.pop(key) ---, return value

dict.pop(item) ---, return (key, value)
